

# CLEAN METALS SAMPLING

Defined as the method used for identifying and comparing dissolved trace metal concentrations to predefined water quality standards, clean metal sampling and analyses are required tests for many VPDES permit holders.

With a high risk of environmental contamination, metals sampling procedures are critical in detecting ultra low concentrations. ESS has 10 years of experience with this delicate process and is able to provide your company with a start-to-finish program.

## ESS Provides Technical Expertise

QC Blanks performed with each test

Properly cleaned sample bottles and equipment

Equipment stored in plastic to prevent contamination

Knowledge of Critical Control Points in sampling protocol

Samples maintained at controlled temperature
